

DESIGN AREA

The entire template is the design area. Make sure you maximize the scale of your design within the template. You cannot adjust your artwork once uploaded within the app.

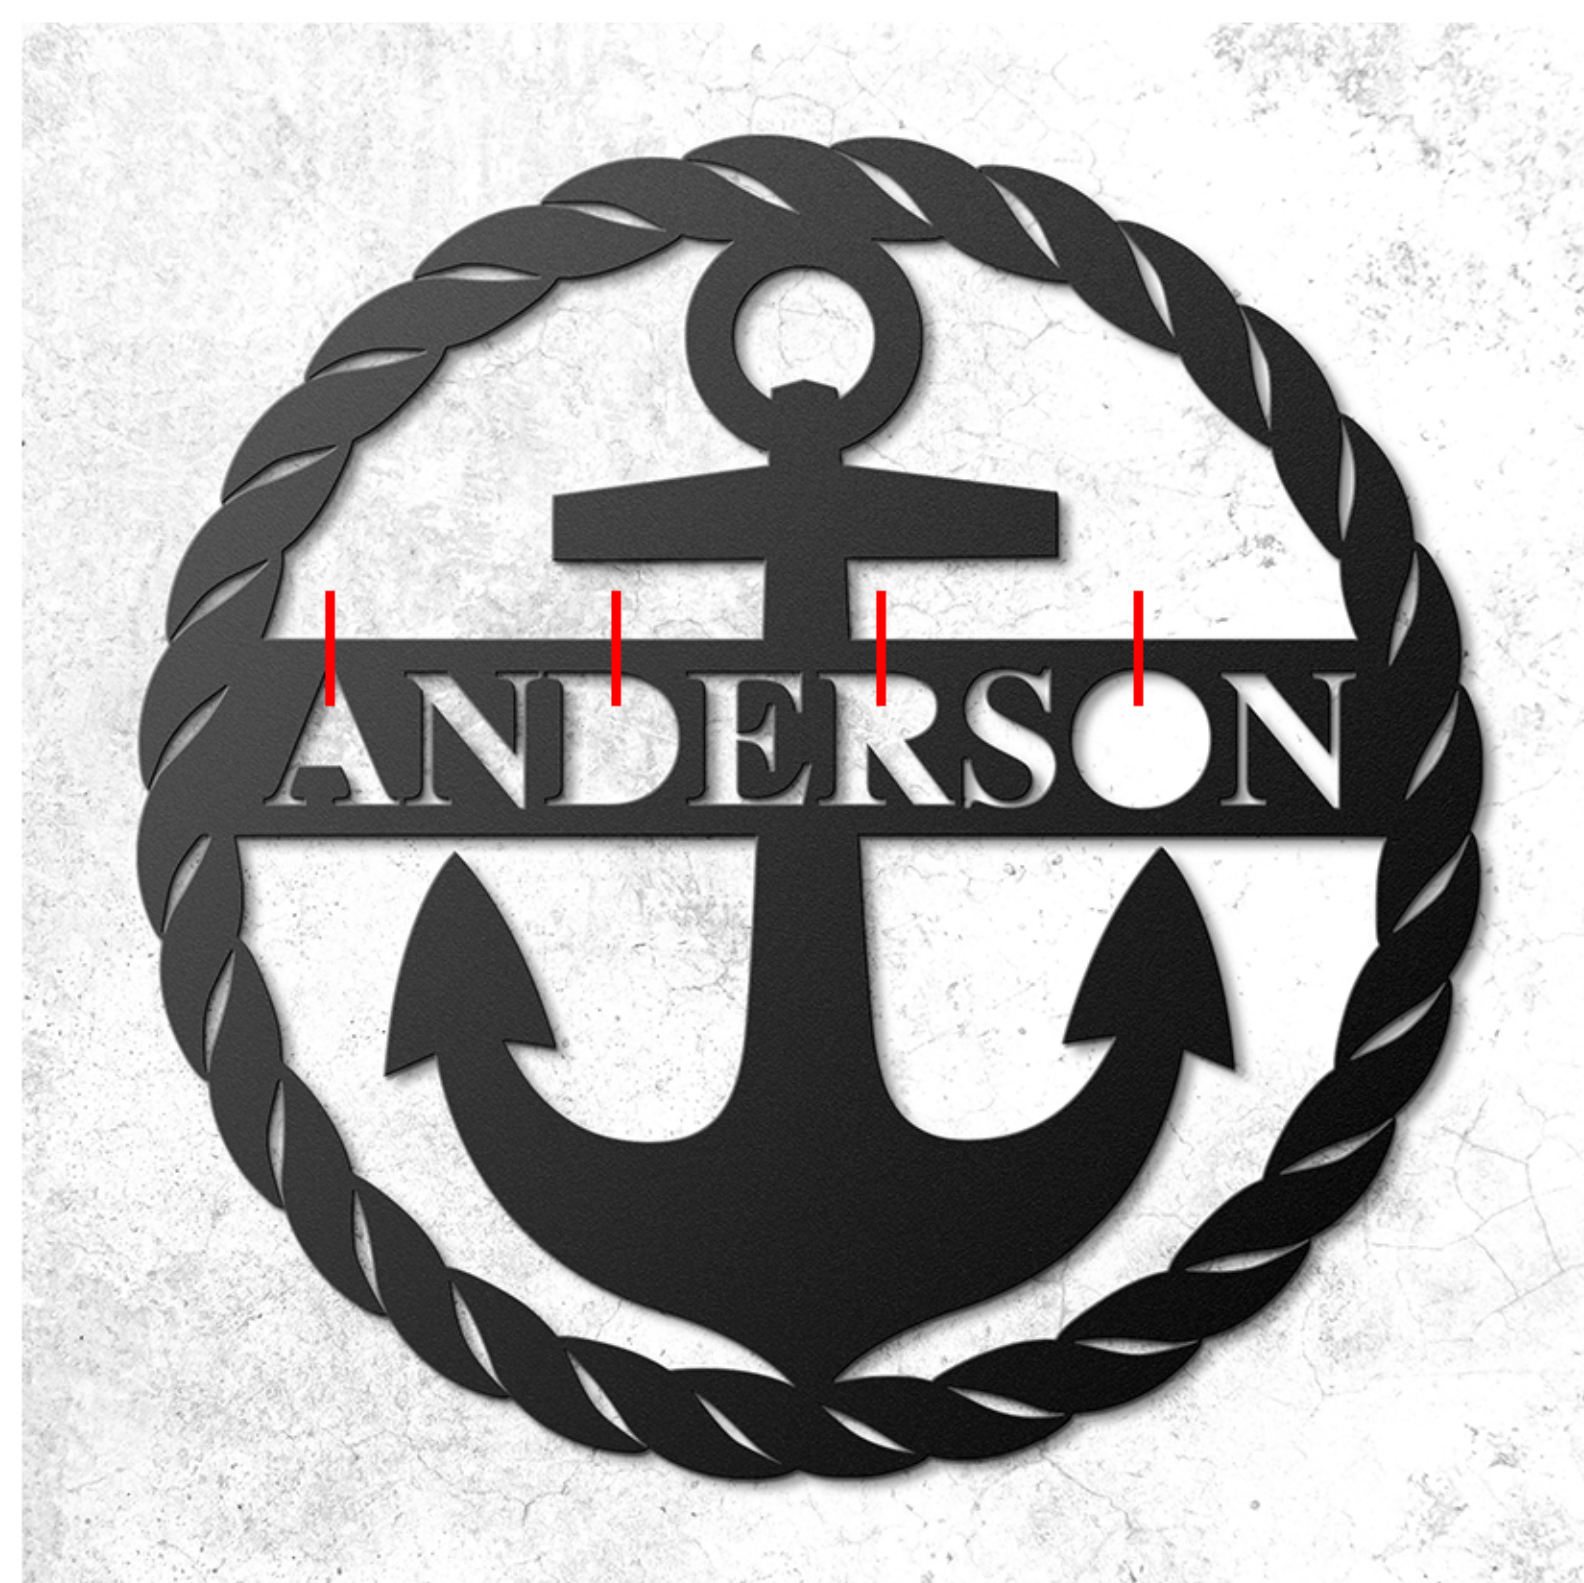

Our system will automatically scale your artwork down depending on what size product your customer purchases. Keep this in mind with your design as fine details will become smaller as the artwork scales down. We strongly recommend keeping your designs simple & legible.

Metal signs must be a transparent PNG file. Prior to saving your artwork, please remove the template layer or any background images. The signs start as a solid sheet of metal and will remove all transparent areas of your design. The laser will not recognize opacity changes, so single color artwork at 100% opacity is recommended.

Any elements not connected will not be on the final product. It is up to you to ensure all points are attached as well as be cautious of how the metal will interact with the structure of your design. Flex points and line weights within your design must be taken into account prior to uploading your artwork.
